

Energy Conservation Measure Description	Estimated Cost	Baseline Efficiency Rating/Description*	Proposed Efficiency Rating/Description
<i>Example (add more lines/pages as needed): Upgrade existing roof with insulation and white TPO roofing</i>	\$200,000	6" concrete over metal deck with dark roofing, no insulation (R-0)	Add R-30 rigid insulation on top of existing deck and apply new white TPO roofing membrane
<b>Totals</b>	-	-	-

\*Assuming this measure does not have a 10 year simple payback or better, the program is looking for “above and beyond”, where the Baseline Efficiency Rating is either the existing conditions (i.e., R-5 insulation value for the existing roof construction) or the current Alabama energy code requirement (i.e., ASHRAE 90.1-2007 requirement of R-20 for climate zone 3A), whichever is more stringent, and the Proposed Efficiency Rating is clearly “above and beyond”.
